

54AC/74AC169•54ACT/74ACT169

4-Stage Synchronous Bidirectional Counter

General Description

The 'AC/'ACT169 is fully synchronous 4-stage up/down counter. The 'AC/'ACT169 is a modulo-16 binary counter. It features a preset capability for programmable operation, carry lookahead for easy cascading and a U/D input to control the direction of counting. All state changes, whether in counting or parallel loading, are initiated by the LOW-to-HIGH transition of the Clock.

Features

- Synchronous counting and loading
- Built-In lookahead carry capability
- Presettable for programmable operation
- Outputs source/sink 24 mA
- 'ACT has TTL-compatible inputs

Ordering Code: See Section 8

Logic Diagram

Please note that this diagram is provided only for the understanding of logic operations and should not be used to estimate propagation delays.

Functional Description

The 'AC/ACT169 uses edge-triggered J-K-type flip-flops and have no constraints on changing the control or data input signals in either state of the Clock. The only requirement is that the various inputs attain the desired state at least a setup time before the rising edge of the clock and remain valid for the recommended hold time thereafter. The parallel load operation takes precedence over the other operations, as indicated in the Mode Select Table. When PE is LOW, the data on the P₀-P₃ inputs enters the flip-flops on the next rising edge of the Clock. In order for counting to occur, both CEP and CET must be LOW and PE must be HIGH; the U/D input then determines the direction of counting. The Terminal Count (TC) output is normally HIGH and goes LOW, provided that CET is LOW, when a counter reaches zero in the Count Down mode or reaches 15 in the Count Up mode. The TC output state is not a function of the Count Enable Parallel (CEP) input level. If an illegal state occurs, the 'AC169 will return to the legitimate sequence within two counts. Since the TC signal is derived by decoding the flip-flop states, there exists the possibility of decoding spikes on TC. For this reason the use of TC as a clock signal is not recommended (see logic equations below).

- 1) Count Enable = $\overline{\text{CEP}} \cdot \overline{\text{CET}} \cdot \text{PE}$
- 2) Up: $\overline{\text{TC}} = \overline{\text{Q}_0} \cdot \overline{\text{Q}_1} \cdot \overline{\text{Q}_2} \cdot \overline{\text{Q}_3} \cdot (\text{Up}) \cdot \overline{\text{CET}}$
- 3) Down: $\overline{\text{TC}} = \overline{\text{Q}_0} \cdot \overline{\text{Q}_1} \cdot \overline{\text{Q}_2} \cdot \overline{\text{Q}_3} \cdot (\text{Down}) \cdot \overline{\text{CET}}$
