

## DIGITAL 8000 SERIES TTL/MEMORY

## DESCRIPTION

The 8224 is a TTL 256 Bit Read Only Memory organized as 32 words with 8 bits per word. The words are selected by five binary address lines with full word decoding incorporated on the chip. A Chip Enable input is provided for additional decoding flexibility, which will cause all eight outputs to go to the high state when the Chip Enable input is taken high.

This device is fully TTL or DTL compatible. The outputs are uncommitted collectors, which allows wired-AND operation with the outputs of other TTL or DTL devices. These outputs are capable of sinking twelve standard DCL loads. Propagation delay time is 50ns maximum. Power dissipation is 310 milliwatts with 400 milliwatts maximum.

The 8224-CB180 has been programmed to convert the seven bit ASC II alphabet code to the 8 bit EBCDIC Alphabet code. The conversion includes the letters A through Z. With the addition of gating circuitry, the 8224-CB180 will convert both upper case and lower case letters.

Customer specified patterns are also available as custom products. Refer to page 4-43 for Truth Table/Order Blank.

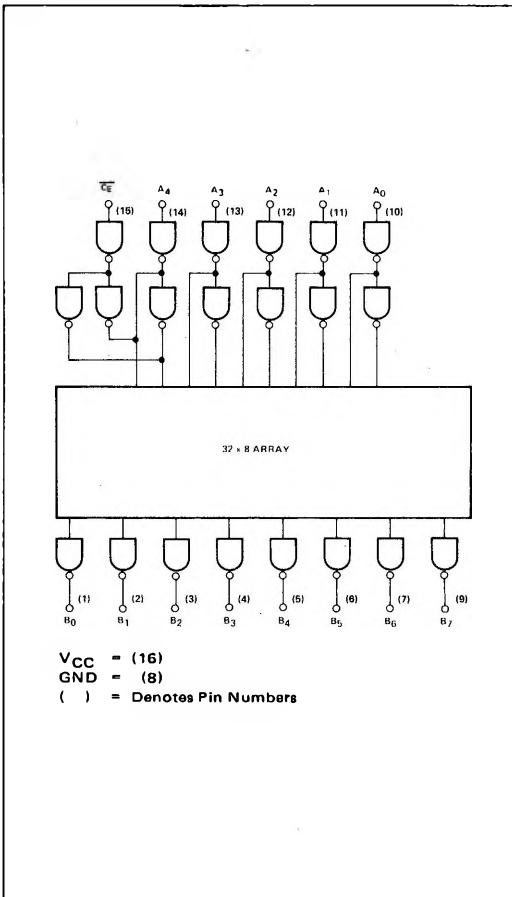

## FEATURES

- BUFFERED ADDRESS LINES
- ON THE CHIP DECODING
- CHIP ENABLE CONTROL LINE
- OPEN COLLECTOR OUTPUTS
- DIODE PROTECTED INPUTS

## APPLICATIONS

MICROPROGRAMMING  
HARDWIRED ALGORITHMS  
CHARACTER RECOGNITION  
CHARACTER GENERATOR  
CONTROL STORE

## NOTES:

- All voltage measurements are referenced to the ground terminal. Terminals not specifically referenced are left electrically open.
- All measurements are taken with ground pin tied to zero volts.
- Positive current flow is defined as into the terminal referenced.
- Positive logic definition:  
"UP" Level = "1", "DOWN" Level = "0".
- Precautionary measures should be taken to ensure current limiting in accordance with Absolute Maximum Ratings should the isolation diodes become forward biased.
- Output sink current is supplied through a resistor to  $V_{CC}$ .
- One DC fan-out is defined as 0.8mA.
- One AC fan-out is defined as 50pF.
- Manufacturer reserves the right to make design and process changes and improvements.
- By DC tests per the truth table, all inputs have guaranteed thresholds of 0.8V for logical "0" and 2.0V for logical "1".
- This test guarantees operation free of input latch-up over the specified operating power supply voltage range.
- For detailed test conditions, see AC testing.
- Connect an external 1k resistor from  $V_{CC}$  to the output terminal for this test.
