

DESCRIPTION

These high-performance 4-bit registers feature a 110-megahertz typical maximum shift-frequency which makes them particularly attractive for very high-speed data processing systems. As the pin assignments are the same as the S54195 and N74195, existing systems can in most cases be upgraded merely by utilizing the Schottky-clamped versions. The registers have two modes of operation:

Parallel (Broadside) Load
Shift (In the direction Q_A toward Q_D)

Parallel loading is accomplished by applying the four bits of data and taking the shift/load control input low. The data is loaded into the associated flip-flop and appears at the outputs after the positive transition of the clock input. During loading, serial data flow is inhibited.

Shifting is accomplished synchronously when the shift/load control input is high. Serial data for this mode is entered at the J-K inputs. These inputs permit the first stage to perform as a J-K, D-, or T-type flip-flop as shown in the function table.

These shift registers are fully compatible with other TTL families. All inputs are buffered to lower the drive requirements to one normalized Series 54S/74S load, including the clock input. The S54S195 is characterized for operation over the full military temperature range of -55°C to 125°C ; the N74S195 is characterized for operation from 0°C to 70°C .

PIN CONFIGURATION

FEATURES

- SCHOTTKY-CLAMPED TO ACHIEVE TYPICAL MAXIMUM SHIFT FREQUENCY OF 110 MHz
- FUNCTIONALLY AND MECHANICALLY IDENTICAL TO N54195, S74195 AND CAN BE USED TO UPGRADE EXISTING DESIGNS WITH SIGNIFICANT IMPROVEMENT IN SPEED
- FULLY COMPATIBLE WITH OTHER TTL CIRCUITS
- N54S195 OPERATES OVER FULL MILITARY TEMPERATURE RANGE OF -55°C TO 125°C
- USE IN HIGH-PERFORMANCE:
ACCUMULATORS/PROCESSORS
SERIAL-TO-PARALLEL,
PARALLEL-TO-SERIAL CONVERTERS

H = High level (steady state)

L = Low level (steady state)

X = Irrelevant (any input, including transitions)

$\uparrow$ = Transition from low to high level

A, B, C, D, = The level of steady state input at A, B, C, or D respectively

Q_{A0} , Q_{B0} , Q_{C0} , Q_{D0} = the level of Q_A , Q_B , Q_C , or Q_D respectively before the indicated steady state input conditions were established.

*For conditions shown as MIN or MAX, use the appropriate value specified under recommended operating conditions for the applicable device type.

**All typical values are at $V_{CC} = 5 \text{ V}, T_A = 25^\circ\text{C}.$

†Not more than one output should be shorted at a time, and duration of the short-circuit test should not exceed one second.

NOTES: 1. With all outputs open, shift/load grounded, and 4.5 V applied to the J, K, and data inputs, I_{CC} is measured by applying a momentary ground, followed by 4.5 V, to clear and then applying a momentary ground, followed by 4.5 V, to clock.

2. Load circuit and waveforms are shown on page 2-293 with the following additions: $t_{w(clock)} \geq 12 \text{ ns}, t_{w(clear)} \geq 12 \text{ ns}.$
