

NM93C06/C46/C56/C66 **256-/1024-/2048-/4096-Bit Serial EEPROM** **(MICROWIRE™)**

General Description

The NM93C06/C46/C56/C66 devices are 256/1024/2048/4096 bits, respectively, of CMOS non-volatile electrically erasable memory divided into 16/64/128/256 16-bit registers. They are fabricated using National Semiconductor's floating-gate CMOS process for high reliability and low power consumption. These memory devices are available in an SO package for small space considerations.

The serial interface that operates these EEPROMs is MICROWIRE compatible for simple interface to standard microcontrollers and microprocessors. There are 7 instructions that control these devices: Read, Erase/Write Enable, Erase, Erase All, Write, Write All, and Erase/Write Disable. The ready/busy status is available on the DO pin to indicate the completion of a programming cycle.

Features

- Device status during programming mode
- Typical active current of 400 μ A; Typical standby current of 25 μ A
- Direct Write
- Reliable CMOS floating gate technology
- 4.5V to 5.5V operation in all modes
- MICROWIRE compatible serial I/O
- Self-timed programming cycle
- 40 years data retention
- Endurance: 10^6 data changes
- Packages available: 8-pin SO, 8-pin DIP

t_{DF}	CS to DO in TRI-STATE®	NM93C06-NM93C66 NM93C06E-NM93C66E NM93C06M-NM93C66M	AC Test CS = V_{IL}		100 100 200	ns
t_{WP}	Write Cycle Time				10	ms

* $t_{DH} = 70$ ns for the NM93C06 and NM93C46

Capacitance (Note 6)

$T_A = 25^\circ C$ $f = 1$ MHz

Symbol	Test	Typ	Max	Units
C_{OUT}	Output Capacitance		5	pF
C_{IN}	Input Capacitance		5	pF

AC Test Conditions

Output Load	1 TTL Gate and $C_L = 100$ pF
Input Pulse Levels	0.4V to 2.4V
Timing Measurement Reference Level	
Input	1V and 2V
Output	0.8V and 2V

Note 1: Stress above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note 2: The SK frequency specification for Commercial and Extended temperature range parts specifies a minimum SK clock period of 1 μs ; therefore, in an SK clock cycle, $t_{SKH} + t_{SKL}$ must be greater than or equal to 1 μs . For example, if $t_{SKL} = 250$ ns, then the minimum $t_{SKH} = 750$ ns in order to meet the SK frequency specification.

Note 3: The SK frequency specification for Military Temperature parts specifies a minimum SK clock period of 2 μs ; therefore, in an SK clock cycle, $t_{SKH} + t_{SKL}$ must be greater than or equal to 2 μs . For example, if the $t_{SKL} = 500$ ns, then the minimum $t_{SKH} = 1.5$ μs in order to meet the SK frequency specification.

Note 4: For Commercial and Extended temperature range parts, CS must be brought low for a minimum of 250 ns (t_{CS}) between consecutive instruction cycles.

Note 5: For Military Temperature parts, CS must be brought low for a minimum of 500 ns (t_{CS}) between consecutive instruction cycles.

Note 6: This parameter is periodically sampled and not 100% tested.

Functional Description

The NM93C06/C46/C56/C66 devices have 7 instructions as described below. Note that the MSB of any instruction is a "1" and is viewed as a start bit in the interface sequence. For the C06 and C46 the next 8 bits carry the op code and the 6-bit address for register selection. For the C56 and C66 the next 10-bits carry the op code and the 8-bit address for register selection.

Read (READ):

The Read (READ) instruction outputs serial data on the DO pin. After a READ instruction is received, the instruction and address are decoded, followed by data transfer from the selected memory register into a 16-bit serial-out shift register. A dummy bit (logical 0) precedes the 16-bit data output string. Output data changes are initiated by a low to high transition of the SK clock.

Erase/Write Enable (EWEN):

When V_{CC} is applied to the part, it powers up in the Erase/Write Disable (EWDS) state. Therefore, all programming modes must be preceded by an Erase/Write Enable (EWEN) instruction. Once an Erase/Write Enable instruction is executed, programming remains enabled until an Erase/Write Disable (EWDS) instruction is executed or V_{CC} is removed from the part.

Erase (ERASE):

The ERASE instruction will program all bits in the specified register to the logical '1' state. CS is brought low following the loading of the last address bit. This falling edge of the CS pin initiates the self-timed programming cycle.

The DO pin indicates the READY/BUSY status of the chip if CS is brought high after a minimum of 250 ns (t_{CS}). DO = logical '0' indicates that programming is still in progress. DO = logical '1' indicates that the register, at the address specified in the instruction, has been erased, and the part is ready for another instruction.

NOTE: The NM93C06/C46/C56/C66 devices do not require an 'ERASE' or 'ERASE ALL' prior to the 'WRITE' and 'WRITE ALL' instructions. The 'ERASE' and 'ERASE ALL' instructions are included to maintain compatibility with the NMOS NMC9346.

Write (WRITE):

The Write (WRITE) instruction is followed by 16 bits of data to be written into the specified address. After the last bit of data is put on the data-in (DI) pin, CS must be brought low before the next rising edge of the SK clock. This falling edge of CS initiates the self-timed programming cycle. The DO pin indicates the READY/BUSY status of the chip if CS is brought high after a minimum of 250 ns (t_{CS}). DO = logical 0 indicates that programming is still in progress. DO = logical 1 indicates that the register at the address specified in the instruction has been written with the data pattern specified in the instruction and the part is ready for another instruction.

Erase All (ERAL):

The ERAL instruction will simultaneously program all registers in the memory array and set each bit to the logical '1' state. The Erase All cycle is identical to the ERASE cycle except for the different op-code. As in the ERASE mode, the DO pin indicates the READY/BUSY status of the chip if CS is brought high after a minimum of 250 ns (t_{CS}). The ERASE ALL instruction is not required, see note below.

Write All (WRAL):

The (WRAL) instruction will simultaneously program all registers with the data pattern specified in the instruction. As in the WRITE mode, the DO pin indicates the READY/BUSY status of the chip if CS is brought high after a minimum of 250 ns (t_{CS}).

Erase/Write Disable (EWDS):

To protect against accidental data disturb, the Erase/Write Disable (EWDS) instruction disables all programming modes and should follow all programming operations. Execution of a READ instruction is independent of both the EWEN and EWDS instructions.

Instruction Set for the NM93C06 and NM93C46

Instruction	SB	Op Code	Address	Data	Comments
READ	1	10	A5-A0		Reads data stored in memory, at specified address.
EWEN	1	00	11XXXX		Write enable must precede all programming modes.
ERASE	1	11	A5-A0		Erase register A5A4A3A2A1A0.
WRITE	1	01	A5-A0	D15-D0	Writes register.
ERAL	1	00	10XXXX		Erases all registers.
WRAL	1	00	01XXXX	D15-D0	Writes all registers.
EWDS	1	00	00XXXX		Disables all programming instructions.

Instruction Set for the NM93C56 and NM93C66

Instruction	SB	Op Code	Address	Data	Comments
READ	1	10	A7-A0		Reads data stored in memory, at specified address.
EWEN	1	00	11XXXXXX		Write enable must precede all programming modes.
ERASE	1	11	A7-A0		Erase register A7A6A5A4A3A2A1A0.
ERAL	1	00	10XXXXXX		Erases all registers.
WRITE	1	01	A7-A0	D15-D0	Writes register if address is unprotected.
WRAL	1	00	01XXXXXX	D15-D0	Writes all registers.
EWDS	1	00	00XXXXXX		Disables all programming instructions.

Timing Diagrams

Synchronous Data Timing

*This is the minimum SK period (Note 2).

t_{SKS} is not needed if $DI = V_{IL}$ when CS is going active (HIGH).

TL/D/10751-4

READ:

*Address bits A_5 and A_4 become "don't care" for NM93C06.

*Address bit A_7 becomes a "don't care" for NM93C56.

TL/D/10751-5

EWEN:

*The NM93C56 and NM93C66 require a minimum of 11 clock cycles. The NM93C06 and NM93C46 require a minimum of 9 clock cycles.

TL/D/10751-6

Timing Diagrams (Continued)

EWDS:

*The NM93C56 and NM93C66 require a minimum of 11 clock cycles. The NM93C06 and NM93C46 require a minimum of 9 clock cycles.

TL/D/10751-7

WRITE:

*Address bit A₅ and A₄ become "don't care" for NM93C06.

*Address bit A₇ becomes a "don't care" for NM93C56.

TL/D/10751-8

WRAL:†

*The NM93C56 and NM93C66 require a minimum of 11 clock cycles. The NM93C06 and NM93C46 require a minimum of 9 clock cycles.

TL/D/10751-9

Timing Diagrams (Continued)

TL/D/10751-10

*Address bits A5 and A4 are "don't care" for NM93C06.

*Address bits A7 is "don't care" for NM93C56.

TL/D/10751-11
